ANALYSIS

# THE MYTH OF THE CRIMINAL IMMIGRANT

The link between immigration and crime exists  
in the imaginations of Americans, and nowhere else.

By ANNA FLAGG

The Trump administration's first year of immigration policy has relied on claims that immigrants bring crime into America. President Trump's latest target is sanctuary cities.

"Every day, sanctuary cities release illegal immigrants, drug dealers, traffickers, gang members back into our communities," he said last week. "They're safe havens for just some terrible people."

This story was published in collaboration with [The New York Times's Upshot](#).

As of 2017, according to [Gallup polls](#), almost half of Americans agreed that immigrants make crime worse. But is it true that immigration drives crime? Many studies have shown that it does not.

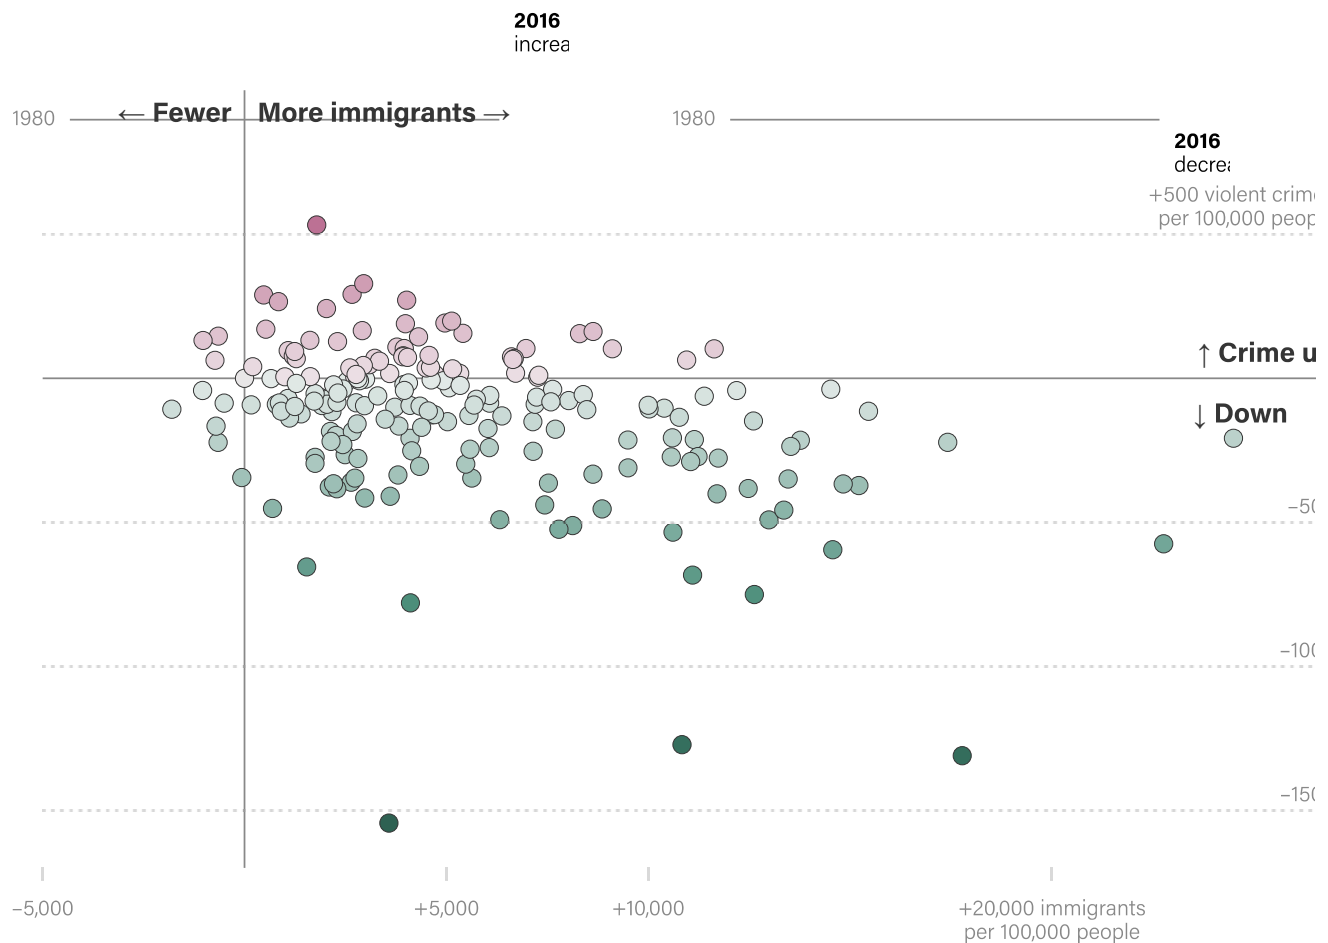

Immigrant populations in the United States have been growing fast for decades now. Crime in the same period, however, has moved in the opposite direction, with the national rate of violent crime today well below what it was in 1980.

In a large-scale [collaboration](#) by four universities, led by Robert Adelman, a sociologist at the State University of New York at Buffalo, researchers compared immigration rates with crime rates for 200 metropolitan areas over the last several decades. The selected

in America had huge urban hubs like New York and smaller manufacturing centers less than a hundred miles apart. In the 1980s, like Muncie, Ind., and were dispersed geographically across the country.

### Immigrant population and violent crime by metro area

Change between 1980 and 2016

According to data from the study, a large majority of the areas have many more immigrants today than they did in 1980 and fewer violent crimes. The Marshall Project extended the study's data up to 2016, showing that crime fell more often than it rose even as immigrant populations grew almost across the board.

In 136 metro areas, almost 70 percent of those studied, the immigrant population increased between 1980 and 2016 while crime stayed stable or fell. The number of areas where crime and immigration both increased was much lower — 54 areas, slightly more

than a quarter of the total. The 10 places with the largest increases in immigrants all had lower levels of crime in 2016 than in 1980.

And yet the argument that immigrants bring crime into America has driven many of the policies enacted or proposed by the administration so far: restrictions to entry, travel and visas; heightened border enforcement; plans for a wall along the border with Mexico. This month, the Justice Department filed a [lawsuit](#) against California in response to the state's refusal to allow local police to assist Immigration and Customs Enforcement officers in detaining and deporting undocumented immigrants charged with crimes. On Tuesday, California's [Orange County](#) signed on in support of that suit. But while the immigrant population in the county has more than doubled since 1980, overall violent crime has decreased by more than 50 percent.

There's a similar pattern in two other places where Trump has recently feuded with local leaders: Oakland, Calif., and Lawrence, Mass. He described both cities as breeding grounds for drugs and crime brought by immigrants. But Oakland, like Orange County, has had increasing immigration and falling crime. In Lawrence, though murder and robbery rates grew, overall violent crime rates still fell by 10 percent.

In general, the study's data suggests either that immigration has the effect of reducing average crime, or that there is simply no relationship between the two, and that the 54 areas in the study where both grew were instances of coincidence, not cause and effect. This was a consistent pattern in each decade from 1980 to 2016, with immigrant populations and crime failing to grow together.

Click on a line below to see how a metro area has changed since 1980. For example, in ATLANTA the immigrant population skyrocketed while violent crime fell. One of the largest decreases in crime occurred in MIAMI, where immigration increased. WICHITA, KAN. is one of the 27% of areas where immigration and crime both grew.

Search by metro area

In a majority of areas, the number of immigrants increased at least 57 percent and as much as 183 percent, with the greatest increases occurring in the 1990s and early 2000s. Violent crime rates in most areas ranged between a 43 percent decline and a 6 percent rise, often trending downward by the 2000s. Places with a sharp rise in the immigrant population experienced increases in crime rates no more frequently than those with modest or no growth in immigration. On average, the immigrant population grew by 137 percent between 1980 and 2016, with average crime falling 12 percent over the same period.

Because the F.B.I. changed how rape was defined in its crime figures, that category could not be included in this analysis. Focusing on the other components of the violent crime rate — assaults, robberies and murders — still fails to reveal a relationship with immigration rates.

Search by metro area

1980 ————— 1980 ————— 1980 ————— 1980 —————

Most areas experienced decreases in all types of violent crime. The change in assault rates ranged from a 34 percent decline to a 29 percent rise, while robbery rates declined in the range of 12 percent to 57 percent, and murder rates declined in the range of 15 percent to 54 percent.

This analysis is one of the most comprehensive longitudinal studies of the local immigrant-crime relationship. It spans decades of metropolitan area data,

incorporating places with widely differing social, cultural and economic backgrounds, and a broad range of types of violent crime.

Areas were chosen to reflect a range of immigrant composition, from Wheeling, W. Va., where one in 100 people was born outside the United States, to Miami, where every second person was. Some areas were home to newly formed immigrant communities; other immigrant pockets went back generations. Controlling for population characteristics, unemployment rates and other socioeconomic conditions, the researchers still found that, on average, as immigration increases in American metropolises, crime decreases.

The foreign-born data, which is collected through the census, most likely undercounts the numbers of undocumented immigrants, many of whom might wish to avoid the risk of identifying themselves. They are, however, at least partly represented in the overall foreign-born population counts.

This is not the only study showing that immigration does not increase crime. A broad survey released in January examined years of research on the immigrant-crime connection, concluding that an overwhelming majority of studies found either no relationship between the two or a beneficial one, in which immigrant communities bring economic and cultural revitalization to the neighborhoods they join.

---

## ABOUT THE DATA

In the recent study, Adelman and his team collected crime and foreign-born population data for 200 metropolitan statistical areas for the years 1970, 1980, 1990, 2000 and 2010. The Marshall Project extended the data set to include 2016, obtaining foreign-born numbers from the American Community Survey one-year estimates and crime figures from the F.B.I. Uniform Crime Reporting Program metropolitan area data sets. When either foreign-born or crime information was unavailable for 2016, the corresponding 2015 data was substituted.

Some metropolitan areas changed over time, growing to include additional regions, or splitting into separate ones. The Marshall Project consulted with the study researchers to determine when a larger area was still an appropriate match to the original described in the study. When an area split into

components, raw data from each was added to calculate rates approximating the original region. When no reasonable approximation to the original area could be found, it was marked as missing for 2016.

When an area was missing information for a certain year, that year's data was interpolated using figures from the closest year available. For example, crime numbers were unavailable for Chicago for 2000 and 2010. Data for those years was linearly interpolated using the 1990 and 2016 figures. Charlotte, N.C., was not included in either the 2016 or 2015 U.C.R. metropolitan area data sets, so data from 2010, the most recent year with available data for this area, was used as an estimate.
